Researchers at Allora Labs demonstrate that intentionally worsening individual AI models through genetic mutations improves their collective performance

NEW YORK, Sept. 2, 2026 /PRNewswire/ â?? Current AI systems are limited by their inability to adapt when the world they were trained on changes. A new paper by the Chief Scientist at Allora Labs proves mathematically that this fundamental limitation can be overcome using the same evolutionary principles that generated intelligence in nature. The research shows that introducing deliberate random mutations into a population of AI models enables the population to collectively outperform any single optimized model as the world around it changes. The paper is titled â??Flawed in Nature, Perfect through Evolutionâ?• and is published in the journal Allora Decentralized Intelligence.

â??Any single AI model, no matter how well trained, accumulates error the moment the world it was trained on changes,â?• says Dr. Diederik Kruijssen, Chief Scientist at Allora Labs and the paperâ??s author. â??This is an inescapable information-theoretic ceiling. We prove that a population of deliberately diversified models breaks through that ceiling, for the same reason that biological species survive environmental change. They exhibit pre-existing variation, some of which is well-suited to the post-change world.â?•

The key insight draws directly from evolutionary biology. In nature, species maintain genetic variation through mutation. Most mutations are harmful to the individual organism, but the population benefits because some variants happen to be well-suited to new conditions when the environment shifts. This research demonstrates that the same principle applies to AI model populations: each mutated model is individually worse, but the best model in the mutated swarm outperforms the best model in an optimized swarm approximately 80% of the time when conditions change.

â??The idea that individual imperfection enables collective adaptation is well-established in evolutionary theory, but seeing it formalized with mathematical guarantees for artificial systems is a significant step. This work opens a new dimension for thinking about AI robustness under changing conditions.â?•â?? Prof. Steven Longmore, Liverpool John Moores University, AI-driven biodiversity conservation

The paperâ??s four mathematical theorems prove, step by step, that no single model can escape this performance ceiling, and that a population of mutated models provably breaks through it. Numerical experiments validate all four theorems, with the mutated swarmâ??s combined output outperforming the original at high statistical significance.

The advantage peaks when the rate at which models mutate roughly matches the rate at which the environment is changing: a â??Goldilocks zoneâ?• that mirrors evolutionary dynamics. The optimal regime is broad: there is about a hundredfold range around the peak, and the penalty for mutating too slowly is gentle, while mutating too fast degrades performance sharply. This forgiving behavior opens up practical applications.

Nick Emmons, CEO of Allora Labs, says about the work: â??As AI systems are deployed in financial markets, healthcare, autonomous vehicles, and other environments that change constantly, the inability to adapt to shifting conditions has become their primary failure mode. Most AI research focuses on making individual models bigger and faster. We think the bigger gain is in how populations of models interact and evolve, and this work proves thatâ??s the right perspective.â?•

â??The qualities we associate with intelligence, like originality, adaptability, and creativity, all require the ability to perform well under conditions youâ??ve never encountered before,â?• says Dr. Kruijssen. â??Current AI models canâ??t do that. They replicate what theyâ??ve learned, but they donâ??t adapt to the unknown. A population of evolving models can. Thatâ??s what this work demonstrates, and itâ??s what evolution has been doing for billions of years.â?•

The paper outlines several future directions, including the application of the Flawed-in-Nature principle to large language models through fine-tuning methods, its extension to decentralized AI networks, and the development of a controller algorithm that tunes mutation strength automatically without requiring knowledge of how the environment changes. â??A result like this opens up so many downstream directions,â?• adds Dr. Kruijssen. â??Our team has already built the controller that makes this principle work in practice, and the work on several concrete applications has started too.â?•

About Allora Labs

Allora Labs is the main developing contributor to Allora Network, a decentralized AI inference network that harnesses a globally distributed community of machine learning models to produce highly accurate, context-aware predictions in real time. Founded by CEO Nick Emmons, Allora Labs conducts research in swarm intelligence, model coordination, and inference synthesis. The company has partnered with organizations including AWS, Alibaba Cloud, Saudi Telecom, and Vodafoneâ??s Pairpoint, and has raised backing from investors including Polychain, Framework, Blockchain Capital, and CoinFund. To learn more, visit alloralabs.xyz and allora.network.

About Allora Decentralized Intelligence

Allora Decentralized Intelligence (ADI) is a scholarly research journal publishing innovation in decentralized machine intelligence, model coordination, and swarm intelligence. ADI was founded and is led by Dr. Diederik Kruijssen, Chief Scientist at Allora Labs. He is an AI/ML researcher and astrophysicist with 20 years of experience in state-of-the-art quantitative modeling across research, tech, finance, and web3, and authored more than 300 peer-reviewed publications.
